

Department of Computer Technology

Vision of the Department

To be a well-known centre for pursuing computer education through innovative pedagogy, value-based education and industry collaboration.

Mission of the Department

To establish learning ambience for ushering in computer engineering professionals in core and multidisciplinary area by developing Problem-solving skills through emerging technologies.

Session 2025-2026

Vision: Dream of where you want.	Mission: Means to achieve Vision
---	---

Program Educational Objectives of the program (PEO): (broad statements that describe the professional and career accomplishments)

PEO1	Preparation	P: Preparation	Pep-CL abbreviation pronounce as Pep-si-IL easy to recall
PEO2	Core Competence	E: Environment	
PEO3	Breadth	(Learning Environment)	
PEO4	Professionalism	P: Professionalism	
	Learning	C: Core Competence	
PEO5	Environment	L: Breadth (Learning in diverse areas)	

Program Outcomes (PO): (statements that describe what a student should be able to do and know by the end of a program) **Keywords of POs:**

Engineering knowledge, Problem analysis, Design/development of solutions, Conduct Investigations of Complex Problems, Engineering Tool Usage, The Engineer and The World, Ethics, Individual and Collaborative Team work, Communication, Project Management and Finance, Life-Long Learning

PSO Keywords: Cutting edge technologies, Research

“I am an engineer, and I know how to apply engineering knowledge to investigate, analyse and design solutions to complex problems using tools for entire world following all ethics in a collaborative way with proper management skills throughout my life.” *to contribute to the development of cutting-edge technologies and Research.*

Integrity: I will adhere to the Laboratory Code of Conduct and ethics in its entirety.

Name and Signature of Student and Date

(Signature and Date in Handwritten)

Devid Deshmukh

Department of Computer Technology

Vision of the Department

To be a well-known centre for pursuing computer education through innovative pedagogy, value-based education and industry collaboration.

Mission of the Department

To establish learning ambience for ushering in computer engineering professionals in core and multidisciplinary area by developing Problem-solving skills through emerging technologies.

Session	2025-26 (ODD)	Course Name	Computer vision Lab
Semester	5	Course Code	CT
Roll No	44	Name of Student	Devid Deshmukh

Practical Number	9
Course Outcome	Upon successful completion of the course the students will be able to 1. Apply image enhancement and smoothing techniques to improve image quality for further analysis. 2. Extract meaningful features from images using descriptors such as HOG and SIFT. 3. Implement and evaluate modern object detection methods including YOLO and R-CNN. 4. Analyze and develop solutions for motion estimation, object recognition, and facial expression recognition using classical and learning-based methods.
Aim	Implement Facial Expression Recognition.
Problem Definition	To develop a system that can automatically detect human faces and recognize their facial expressions from images or live video streams using computer vision and deep learning techniques.
Theory (100 words)	<ul style="list-style-type: none">• Facial expressions are universal indicators of human emotions and are key to non-verbal communication. The ability to automatically recognize facial expressions has applications in areas like human-computer interaction, healthcare, security, driver monitoring, virtual reality, and emotion-based marketing. Facial Expression Recognition (FER) is a branch of computer vision and pattern recognition that focuses on identifying the emotional state of a person from their facial appearance.
Procedure and Execution (100 Words)	Algorithm: 1. Input: Training dataset of facial features with emotion labels. 2. Initialize equal weights to all samples. 3. For $t = 1$ to T (number of weak classifiers): a. Train a weak classifier $h_t(x)$ on weighted samples. b. Compute error rate $\epsilon_t = \sum(\text{weights of misclassified samples})$. c. Compute classifier weight $\alpha_t = \frac{1}{2} * \ln((1 - \epsilon_t) / \epsilon_t)$ d. Update sample weights: - Increase weights for misclassified samples.

	<p>- Decrease weights for correctly classified ones. e. Normalize weights.</p> <p>4. Final strong classifier: $H(x) = \text{sign}(\sum (\alpha_t * h_t(x)))$</p> <p>5. Output: Predicted facial expression.</p>
	<p>Code:</p> <pre>import os import warnings os.environ['TF_CPP_MIN_LOG_LEVEL'] = '3' warnings.filterwarnings('ignore') import cv2 try: from fer import FER except ImportError: from fer.fer import FER # Initialize the FER detector detector = FER(mtcnn=True) # === Provide your image path here === image_path = "ok.jpg" # replace with your image name img = cv2.imread(image_path) if img is None: print(f"Error: Cannot load image '{image_path}'") exit() # Detect emotions in the image result = detector.detect_emotions(img) # Draw results on the image for face in result: (x, y, w, h) = face["box"] emotions = face["emotions"] top_emotion = max(emotions, key=emotions.get) confidence = emotions[top_emotion] # Draw face box cv2.rectangle(img, (x, y), (x + w, y + h), (0, 255, 0), 2) # Show detected emotion text = f'{top_emotion.capitalize()} ({confidence*100:.1f}%)' cv2.putText(img, text, (x, y - 10), cv2.FONT_HERSHEY_SIMPLEX, 0.8, (255, 255, 255), 2) # Display image cv2.imshow("Facial Expression Recognition", img) cv2.waitKey(0)</pre>

	<pre>cv2.destroyAllWindows() #Printresult in console if result: print("Detected emotions:") for face in result: print(face["emotions"]) else: print("No face detected in the image.")</pre>
	<p>Output:</p> 
<p>Output Analysis</p>	<p>The output of the Facial Expression Recognition system shows the detected face in the image with a green box and displays the predicted emotion, such as <i>Happy</i> or <i>Sad</i>, along with its confidence percentage. In the console, it also prints the probability values for all emotions like angry, happy, sad, neutral, etc. The emotion with the highest probability is considered the final detected expression. For example, if the system shows <i>Happy (95%)</i>, it means the model is 95% confident that the person in the image is happy</p>

been uploaded							
Conclusion	In conclusion, the Facial Expression Recognition system successfully detects faces and identifies human emotions like happiness, sadness, anger, or surprise using image processing and deep learning. It provides accurate and real-time emotion analysis, which can be useful in applications like security, healthcare, and human-computer interaction.
